How to calculate motor drive torque for ball screws. May 18, 2016 By Danielle Collins 16 Comments. When sizing a motor, one of the most important factors is the required torque. In general, motor torque-speed curves outline two primary areas of permissible torque: continuous and intermittent.

How to calculate motor drive torque for ball screws

torque again increases but to an amount less than the valve breakaway torque. This torque is known as the valve ending torque. Due to the variable operating torque of a ball valve when scotch yoke type or spring return actuators are used IFC recommends factoring the breakaway torque by 0.7 for the running torque and 0.8 for the valve ending torque.

Breakaway Torque Calculation For Ball Valve

What is breakaway torque? Once torque has been applied to a joint, an audit function measures exactly how tight that fastener was torqued. After being tightened, and torque is applied, there is a point when the fastener begins to move again. That point of movement is "breakaway torque." It starts with selecting the appropriate torque wrench.

What Is Break Away Torque?

The values have been selected on the basis of breakaway torque of the valve. A safety factor, above tested breakaway torque, has been introduced in these tables to allow for the valve torque increase during the lifetime of the seats from deposits on seats and ball. Actuator torque outputs are tabulated for electric and pneumatic actuators.

Torque for PTFE type. The no load breakaway is measured by fixing the ball aligned with the axis of a torque meter. The race or Rod End body shall be held securely by hand or tool but without any force. The ball shall be rotated a few times prior to torque measuring. Torque value shall be read when ball rotates.

the valve torque is at maximum, and actuator torque is at minimum. The 0.70 factor reflects the maximum valve torque expected other than breakaway, and considers that the maximum output torque of the spring return rack and pinion actuator is at the start of the stroke. This would not apply to a scotch yoke or crank arm actuator, because the torque

You should do the same with all linear guides and/or bearings that you have and sum them up. That will be your breakaway torque. For the lead screw: $F = c \cdot N$ where F is the static friction force, c is the static friction constant and N is the normal force. In this case you have to convert the Force to Torque $\text{Torque} = \text{Force} \times \text{Lead} / 2\pi$.
