Problems in Probability: Problems with Solutions

Two coins are tossed, find the probability that two heads are obtained. Note: Each coin has two possible outcomes H (heads) and T (Tails). Solution The sample space S is given by, $S = \{(H,T),(H,H),(T,H),(T,T)\}$ Let E be the event "two heads are obtained", $E = \{(H,H)\}$ We use the formula of the classical probability. $P(E) = n(E) / n(S) = 1 / 4$

Probability Questions with Solutions

Solution: The total number of possible outcomes of rolling a dice once is 6. Hence, the total number of outcomes for rolling a dice twice is $(6 \times 6) = 36$. The probability of getting an odd and even number is 18 and the probability of getting only odd number is 9. i.e., $n(A) = 18$ $n(B) = 9$.
