Summary. An injection-pressure-operated (IPO) gas lift valve's closing force is supplied by a nitrogen charge, acting on the effective area of the bellows (A_b), or a spring force. Traditionally, the opening force is the production pressure acting on the area of the port (A_p) plus the injection pressure acting on the bellows effective area minus the area of the port ($A_b - A_p$).

The paper describes an empirical law of friction for rock joints which can be used both for extrapolating and predicting shear strength data. The equation is based on three index parameters; the joint roughness coefficient JRC , the joint wall compressive strength JCS , and the residual friction angle ϕ_r . All these index values can be measured in the laboratory. They can also be measured in the ...

Geotechnical engineering, also known as geotechnics, is the branch of civil engineering concerned with the engineering behavior of earth materials. It uses the principles and methods of soil mechanics and rock mechanics for the solution of engineering problems and the design of engineering works. It also relies on knowledge of geology, hydrology, geophysics, and other related sciences.

Engineering Classification of Rock Masses for the Design of Tunnel Support. An analysis of some 200 tunnel case records has revealed a useful correlation between the amount and type of permanent support and the rock mass quality Q , with respect to tunnel stability. The numerical value of Q ranges from 0.001 (for exceptionally poor quality squeezing-ground) up to 1000 (for exceptionally good ...
